

Measured end-to-end prefill speedup from the re-tuning (2048-token real-text prompt)

Bars: median tok/s re-tuned / previous, 5 interleaved repeats per build; CI = paired bootstrap.
Hollow markers: earlier Amdahl projection from kernel times (none for Orin 8B); within 3.1 % everywhere.
† previous WMMA kernels were opt-in (default path ran tiled); measured here with their opt-in env.
